DETAILED ACTION

1. The following is a Non-Final Office Action in response to the applicant's submission filed March 21, 2002. Claims 1-19 are pending.

Claim Objections

2. Claims 4-10 and 14 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims have not been further treated on the merits.

Claim Rejections - 35 USC § 112

- 3. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 4. Claim 3 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The limitation that "at least one of" comprises a "plurality of said resources" is unclear since "at least one of" can mean one, but a "plurality" is more than one.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Page 3

6. Claims 1-3, 11-13, 15-17 and 19 are rejected under 35 U.S.C. 102(b) as being anticipated by Du et al (US 5,826,239).

As per claims 1, 11, 15 and 19, Du teaches storing constraint definition data defining constraints on said allocation of resources (column 9, lines43-45 where HP OpenPM evaluates the rules and performs the rule actions when the rule conditions are met, whereby the rule conditions constitute the constraints of the resource allocation system.); storing an initial data representation of resource availability (column 4, lines 27-28 where the system checks a central site for availability of resource groups, whereby the central site constitutes a storage of initial data); receiving from a resource interface, availability data concerning availability of a resource (column 8, lines 35-38, where the work nodes include resource allocation which constitutes the receipt of available resources as further indicated in Figure 2, where the resource managers (28) resolve resource assignment requests); generating a proposed data representation of resource availability, based on the initial data representation together with said availability data (column 13, lines 6-8, where resource status or availability is provided); determining whether said proposed data representation is compatible with said constraint definition data (column 4, lines 57-67 and column 5, line 1, where the system determines the resource availability with respect to the specified activity and forwards the information to the second computer to assign the resource to the activity.); in the case the data is compatible with the constraint definition data, substituting the proposed

data representation for the initial data representation to generate a new initial data representation (column 4, lines 57-67 and column 5, lines 1-5, where the LRM system assigns the available resources and updates the data in the second computer accordingly.); and in the case the data is not compatible with the constraint definition data, transmitting a rejection signal to at least one resource interface (column 3, lines 34-38 where the tasks are queued when they do not meet the constraints or resource requirements. This is equivalent to sending a reject signal as it performs an identical function in substantially the same manner with substantially the same results. The main purpose of sending the reject signal is to alert the user that resources were not assigned to the task and the purpose for the queue system is the same. Resources were not available to be assigned to the task, but the task is posted in a queue to obtain resources when they become available.).

As per claims 2 and 12, they recite the same limitations as claim 1 except for the following: Du teaches receiving from one resource interface further availability data concerning availability of a resource, generating a further proposed data representation of resource availability, based on the initial data representation together with said further availability data (column 4, lines 57-67 and column 5, lines 1-5, where the LRM system assigns the available resources and updates the data in the second computer accordingly. The updated information would function as further availability data since the computer updates the resources and activities with respect to availability information as the information changes.).

As per claims 3 and 13, recites the same limitations as claim 1 and is therefore subject to the same art rejection. Du teaches multiple resource interfaces in Figure 1 where there are multiple users and machines.

As per claim 16, Du teaches the signal input is also for receiving a management signal input from at least one management interface, one or more of said management signals comprising constraint data with respect to at least one resource, and the apparatus further comprises means for using constraint data received from a management interface to enter or change data in the constraint definition data store (column 19, lines 60-67 where OpenPM contains a rule node which contains a list of condition-action rules or constraints and as indicated in Figure 4 there is a database manager (64) that interacts with the OpenPM database which contains the constraint definition data. In addition, column 9, lines 30-34 teach that the system can interact with external environments.), and means to categorize data in the constraint definition data store according to source type (column 17, lines 40-43 where each resource group has an ID associated with it that acts as a means of sorting or categorizing the constraint information), the apparatus being further adapted, on review of the content of the constraint definition data store, to resolve any conflict in constraint data relevant to a task acceptance signal according to its source type (column 10, lines 48-56 where the resource managers (28) are used to resolve any conflicts between the constraints and the resources so that the resources can be assigned.).

As per claim 17, Du teaches the constraint definition data store is categorized by location in the store. (As noted in Figure 1, the system contains databases. It is well

Application/Control Number: 10/088,687 Page 6

Art Unit: 3623

known that databases store information in files where each file would have a unique "address" or location in the database.)

Claim Rejections - 35 USC § 103

- 7. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 8. Claim 18 is rejected under 35 U.S.C. 103(a) as being unpatentable over Du et al (US 5,826,239).

As per claim 18, Du teaches the source of data in the third category being requirements of an operational support system for use in performing allocated task(s) (column 11, lines 37-50 where the service management layer (102) functions as a support system for performing the tasks) and the apparatus is further adapted to store at least a third category of data in the constraint definition data store (column 9, lines 41-44 where the system evaluates the rules or constraints and performs the rule actions when the rule conditions are met. Whereby "rules" indicates more than one rule.) Official notice is taken that it is old and well known that "rules" may indicate three or more. Therefore it would have been obvious to one of ordinary skill in the art to modify the system of Du with three (or more) rules to provide means for allowing more constraints and consequently, more accurate resource allocation results.

Conclusion

9. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The following art also teaches resource allocation: Du et al (US 6,041,306), Du et al (US 6,078,982), Du (US 6,052,684), Du et al (US 6,041,306), Davis et al (US 6,014,673), Davis et al (US 5,937,388), Davis et al (US 5,870,545), Lesaint et al (US 6,578,005), Lee et al (US 6,263,358), Sisley et al (US 5,943,652), Sisley et al (US 5,467,268), Fields et al (US 5,111,391), Walker et al (US 5,963,911), Ye (US 6,374,227), Homsi (US 7,065,493), Tanaka (US 5,353,229), Purohit et al (WO 99/17194), "Business process flow management and its application in the Telecommunications Management Network-HP's OpenPM middleware technology" by Shan, Hewlett-Packard Journal, October 1996; "A Petri Net based deadlock prevention policy for flexible manufacturing systems" by Ezpeleta et al, IEEE, 1995; "Matchmaking: an extensible framework for distributed resource management" by Raman et al, Baltzer Science Publishers, Cluster Computing, 1999; "Polynomial-complexity deadlock avoidance policies for sequential resource allocation systems" by Reveliotis et al, IEEE, 1997; "Practical Applications of Constraint Programming" by Wallace, Constraints, An International Journal, 1996; "Constraint Satisfaction in Discrete Optimization" by Tsang et al, UNICOM Seminar, March 1998; "WorkWeb System--multi-workflow management with a multi-agent system", by Tarumi et al, ACM SIGGROUP, 1997; "A holonic approach for task scheduling in manufacturing systems" by Ramos, IEEE, 1996; "An agent-based flexible routing manufacturing control simulation system" by Lin et al.
